

## GESTRA's new UNA 25 PK - the first pump trap in standard length

With the UNA 25 PK, the user is given the first pump trap to combine the standard overall length for condensate traps according to ISO 6554 and EN 558 with a high throughput capacity for hot condensate.

Its straight-through body is designed for rapid installation in horizontal lines and allows easy inclusion in steam and condensate systems. In plants with operational parameters

that fluctuate strongly, it is advisable to replace conventional float traps with pump traps – now this is quickly done, thanks to the standard length. Whether flange or threaded connection, the trapping performance of 2,000 kg/h is as impressive as the pumping throughput of 500 kg/h.

These figures, the SG iron material (GGG 40.3) and the attractive price

make the new UNA 25 PK the first choice if you need a reliable solution for systems with changing pressure conditions.
